Final Year Project Report

Full Unit – Final Report

A study in (HCI) human computer interaction

Zain Akhtar

A report submitted in part fulfilment of the degree of

BSc (Hons) in Computer Science

Supervisor: Gregory Gutin

Department of Computer Science

Royal Holloway, University of London

April 10, 2025

Declaration

This report has been prepared on the basis of my own work. Where other published and unpublished source materials have been used, these have been acknowledged.

Abstract

Human-Computer Interaction is the study of how people interact with computers and to design technologies that let humans interact with computers in novel, efficient, and effective ways [4]. This term and concept developed and evolved alongside the evolution of computers. It was popularized when the use of personal computers (PC's) was more prominent and common.

HCI examines the way in which people, users, interact and engage with computers and other technological devices. This goes deeper into a more psychology way of thinking how a person (user) reacts, thinks and the choices they make. HCI investigates concepts like Colour theory and human perception which complements the ideas of digital design and aesthetics to name a few.

Human-computer interaction is very important and prominent in today's world as everything that is designed in a specific way is based on HCI. For example, in E-commerce websites, HCI makes it that the user has a seamless experience (making it efficient, effective and accessible) when browsing or buying which decreases the likelihood of user frustration which could result in a loss of profits and sales. Another example of HCI in everyday life is that of the example taken from Don Norman's book. This is the case of a 'Norman Door'. If a Door has a push plate on the door, then it is meant to be pushed, same goes with a pull bar on a door. However, if it has a push bar or plate and is intended to be pulled then this is a major design floor and is dubbed a 'Norman Door' [2]. Thus, showing the importance and real-life influence of HCI.

The objective of the project is to create a website, and an android based mobile application with HCI in mind. The aim is to use key HCI and user centred design principles to design these interfaces to be effective, efficient, accessible and aesthetically pleasing along with other key factors.

In terms of my early deliverables, I will be creating a website [5]. The website will be an e-commerce site which includes images, text, and navigation [7] with HCI principles in mind. I will be using principles like colour theory [3] and other psychology-based principles that make the user experience as close to perfect as possible. At the same time, I will be creating a questionnaire that users will provide user feedback, highlighting where I can improve the overall interfaces. I will be using HTML, JavaScript [6] and CSS as the languages to create the e-commerce site. In terms of the back-end I will be using SQLite and using the local storage to store data. SQLite will store the prices and ID numbers for the products that will be on display on the website. In terms of the local storage, that will be used when the user has selected what product he wants to be added to their basket.

The final deliverable will be a mobile application [8]. The mobile application, like the website, will be heavily influenced by and designed using HCI principles. The mobile application will also be an e-commerce site. In order to develop the mobile application, I will be using Java [9]. To develop the deliverables, the back end for the deliverables will need to be very specific and centred around HCI [10], which means the user experience needs to be smooth and perform at a high standard.[1]

The questionnaire that I shall be creating and distributing amongst a range of potential users will help me in identifying the needs of a wide range of potential customers to the website and users of the mobile application. I shall be distributing to a wide range of people with different needs. This includes people with and without glasses, sight impairment, colour blindness, dyslexia, different age, different ethnicity, different gender and other varying characteristics. In the end, I shall have retrieved a range of results where I will be acting upon them to cater for the majority to make it accessible to nearly everyone.

Ever since I was young, I have been using computers and programs that have always been designed to provide the best user experience. I have always been intrigued into the concept of why certain things are designed in their specific way. This project will allow me to study and research that exact question.

In conclusion, HCI is vital when it comes to designing and developing technology that ensures a great user experience. This project will apply HCI principles to create a website and a mobile application focusing on usability, aesthetics and accessibility.

Chapter 1: **Introduction, Aims and Objectives**

The following report is a complete and full overview of my project into Human-Computer Interaction (HCI) and how its application in the design and development of a user friendly e-commerce website, with later implementation of a mobile application.

1.1 Aims

The primary aim of this project it to design and develop a user-friendly e-commerce website that adheres to Human-Computer-Interaction (HCI) principles. The website will be aesthetically pleasing, accessible, effective and functional, offering a seamless and easy shopping experience for the users. The project seeks to enhance user engagement, user satisfaction through usability, a responsive design.

1.2 Objectives

1.2.1 Design

- To create a visually aesthetically pleasing and modern interface following HCI principles such as colour theory, aesthetics and human perception.
- Ensure consistency in colouring and layout.

1.2.2 Development

- Implement a functional website using HTML, CSS and JavaScript for front-end
- Implement a function back-end database to store relevant data.

1.2.3 HCI principles

- Implement core HCI principles into the websites design to improve the user experience.

1.2.4 Testing

- Conduct user testing to evaluate the effectiveness of the website.
- Make any necessary changes due to the user feedback.

Chapter 2: **Timescale and Diary**

2.1: Diary

Week 24 7/04/25:

- Continuing with App.
- Continuing Final report.
- Adjustments to the app according to the feedback.
- Adjustments to the Final Report from feedback
- Submitting Project
- Creating Video

Week 23 31/03/25:

- Continuing with App.
- Continuing Final report.
- Adjustments to the app according to the feedback.
- Adjustments to the Final Report from feedback

Week 22 24/03/25:

- Continuing with App.
- Continuing Final report.
- Distributing questionnaire, for user feedback.

Week 21 17/03/25:

- Continuing with App.
- Continuing Final report.

Week 20 10/03/25:

- Continuing with App.

- Continuing Final report.

Week 19 3/03/25:

- Continuing with App.
- Continuing Final report.

Week 18 24/02/25:

- Continuing with App.
- Starting Final report.

Week 17 17/02/25:

- Further continuing with the creation of the App.

Week 16 10/02/25:

- Created pages for Mobile application.

Week 15 03/02/25:

- Started Mobile application.
- Created Mobile emulator.

Week 14 27/01/25:

- Researching into Flutter.
- Researching into the theme of the mobile app.

Week 13 20/01/25:

- N/a

Week 12 9/12/24:

- Completing Report.

- Finalising functionalities of website
- Recorded Video.

Week 11 2/12/24:

- Completing report.
- Finalising website functionalities.
- Completing Presentation.

Week 10 25/11/24:

- Created Product Pages.
- Started Report.
- Created the Basket and Checkout functionality.

Week 9 18/11/24:

- Created Database.
- Updated UI.

Week 8 11/11/24:

- Attempted to create database.
- Created the categories pages.

Week 7 4/11/24:

- Continued Research into HCI.
- Research into Database.

Week 6 28/10/24:

- Created a footer for FAQs and Contact information.
- Made adjustments to Slider.
- Continued Research into HCI.

Week 5: 21/10/24

- Created a Slider for featured items.
- Made small adjustments to code.
- Continued Research into HCI.

Week 4: 14/10/24

- Continuing research into HCI.
- Made a rough start on the Home Page for the website.
- Created a logo.
- Researched into Colour Theory

Week 3: 7/10/24

- Created the Project Plan.
- Started Research into HCI and web development.

2.2 Original Timeline

Weeks	Objectives
Week 1	N/a
Week 2-3	- Create Plan. - Think about the type of website I want to create. - Research into HCI (Basics) - Meet with supervisor. - Set-up GitHub. - Write diary.md. - Create daybook.
Week 4-5	- Research into HCI (Colour Theory, Cognitive Perception, Design, etc). - Study into Website development, more specifically navigation. - Make a draft of the website having used HCI principles.

Week 6-7	- Meet with Supervisor as a catchup, get help where needed. - Continue research into HCI and put them into practice. - Start creating the website with HCI in mind. - Start writing the interim report on the website.
Week 8-9	- Complete interim Report. - Finalize website. - Create and distribute quiz to see whether people like the website.
Week 10-11	- Prepare for presentation. - Finalize Report. - Use user feedback from questionnaire to improve and change the website to increase customer satisfaction. - Present Presentation.

Term 2:

Weeks	Objectives
Week 1	- Research into how to make a mobile application. - Plan the mobile application. - Decide what to do the mobile application about. - Recap on HCI principles.
Week 2-3	- Create drafts for the Mobile Application. - With using Agile Development check that the users are happy, allowing us to go back and check over things. - Start report.
Week 4-5	- Start Mobile Application.
Week 6-7	- Work on Mobile Application.
Week 8-9	- Send out questionnaire to get user feedback.
Week 10-11	- Complete Final Report. - Using the questionnaire, finalise App.
Week 12	- Create Poster - Create Demo

Chapter 3: **Human Computer Interaction**

3.1 Colour Theory

Colour Theory is the theory behind how humans depict and infer certain colours and their characteristics. Colours can evoke emotions such as happiness, anger or sadness. In terms of Human-Computer Interaction (HCI) it influences how users perceive and engage with an interface. For example, the colour purple is most associated with luxury, wealth and royalty, making it an ideal colour choice for brands, or websites to choose this colour if they are trying to promote or sell luxurious products or services.

In my ecommerce website, the colour purple can be seen to be the main colour, as it stands for luxury, as can be seen by some of the high-end fashionable products I have on sale. Along with purple, I have used other contrasting colours to make it more usable for the visually impaired such as those with colour blindness. I have demonstrated this by using colours opposite each other on the colour wheel or using the triangle method for choosing contrasting colours. For example, red and green are used when next to each other to help with visuals.

In the mobile application, I maintained the same colour palette as the website to ensure brand consistency and a seamless user experience. The purple theme was carried over, with careful consideration given to the smaller screen size and touch interactions. To optimize readability, I used lighter shades of purple for backgrounds and darker shades for text. For interactive elements, such as buttons and icons, I used contrasting colours like yellow and blue to make them easily distinguishable.

References:

- Book: Eric Hibit. 2022**. Colour Theory for Dummies**

3.2 Aesthetics

Aesthetics refers to the visually pleasing look of an interface. This significantly impacts user satisfaction and interaction. Aesthetics includes the look and placement of images, text and colour. This concept goes hand in hand with colour theory in the sense of attracting the user by creating a visually stunning user interface with colours.

In my ecommerce website, I have created an aesthetically pleasing user interface by keeping clutter to a minimum and having a sleek and modern finish. The layout features a sleek and modern style, incorporating contemporary colours (as stated before) and navigation. By keeping it modern makes it more aesthetic compared to an old, outdated website.

For the mobile application, I prioritized a clean and minimalist aesthetic to ensure ease of use on smaller screens. I maintained the same modern design language as the website, using similar fonts, colour palettes, and image styles. I focused on large, easy to tap buttons, and icons, to improve the user experience. I have made the application, adapt to different screen sizes, to ensure that the application looks good on any device. I have kept the navigation simple, and easy to use, and made sure that the important elements, are easy to reach with a single thumb. I have also made sure, to keep loading times to a minimum, to increase user satisfaction.

References:

- Book: Patrick W. Jordan. 2002. **Designing Pleasurable Products**.

3.3 Human Perception

Human perception is fundamental to designing interfaces that users can navigate and understand. It involves psychological principles, such as Gestalt laws, to create a sense of structure and hierarchy. These principles ensure related elements are grouped logically, aiding comprehension and reducing cognitive load. Gestalt laws are a set of principles of how to organise and structure objects to describe how people perceive the UI.

In my e-commerce website, I applied these principles by positioning key elements such as navigation menus, product categories, and search bars where users expect to find them, based on typical scanning patterns like the F-pattern. This strategic placement enhances the user's ability to locate information quickly and effortlessly, improving overall usability.

For the mobile application, I adapted these principles to meet the portability of a phone. I employed Gestalt's principle of proximity by grouping related icons and buttons closely together, such as the 'Quantity' and the 'Size', when choosing the specifics of the product to show their likeliness. I also used the principle of figure-ground to make interactive elements, like product images and buttons, stand out against the background. To account for typical mobile usage patterns, I placed the main navigation menu at the bottom of the screen, within easy reach of the user's thumb. This is a universal UI design as it increases efficiency and effectiveness when browsing apps. I also used visual cues, such as highlighted icons and subtle animations, to guide the user's attention and reduce cognitive load.

References:

- Book: Don Norman. 2013. **The Design of Everyday Things.**

3.4 Heuristics

Heuristics, such as Nielsen's 10 usability principles, provide guidance on how to enhance the user experience. These principles include ensuring system visibility, offering user control, and eliminating the use for an instruction manual. Following these standards helps create a seamless and user-friendly interface. Another concept that ties into is that of iconography, where the user is already familiar with certain icons such as a floppy disk for a save button.

For my e-commerce website, I incorporated heuristics by integrating features like a dynamically updating shopping cart and placed certain buttons and navigation where they will be normally placed to eliminate that use of further brain power. A way I have used iconography is by using a cart as the basket which is a universal icon for any e-commerce page or any page where they need to represent a basket. These elements provide real-time feedback and allow users to navigate the site with confidence and eliminate user frustration and confusion.

In the mobile application, I adhered to Nielsen's heuristics by providing clear feedback for user actions, such as visual confirmations when an item is added to the basket or when a payment is processed. I implemented a consistent and constant navigation structure, using familiar icons and labels for menu items. I used icons that are well known to the user, to reduce the need for text, and to save on screen space and save on cognitive overload. I also made sure to keep the number of steps to complete a task, to a minimum. To ensure user control, I included features like an increase and decrease option when in the cart, as well as a delete item function. I also implemented touch-friendly controls, such as larger buttons and swipe gestures, to optimize usability on mobile devices.

References:

- **Book:** Jakob Nielsen. 1993. **Usability Engineering**.

3.5 Usability

Usability focuses on making interfaces easy to learn, efficient to use, and satisfying for the user. It emphasizes reducing complexity and ensuring that users can achieve their goals with minimal effort.

In my e-commerce website, usability has been a top priority. I streamlined the purchase process to minimize the steps required, ensuring users can quickly and efficiently complete transactions. Clear navigation and instructions guide users through the site, while user testing has provided valuable insights to further enhance the interface.

For the mobile application, I focused on optimizing usability for touch interactions. I implemented a simplified navigation structure, using a bottom navigation bar for quick access to essential features, eliminating the usage of two hands. I designed large, touch-friendly buttons and icons to minimize errors and improve efficiency. I used a linear layout, so the user can easily scroll, and not miss any important information. I conducted user testing on various mobile devices to identify and address any usability issues. The application also provides feedback to the user, after any action is taken.

References:

- Book: Steve Krug. 2000. **Don't Make Me Think: A Common-Sense Approach to Web Usability.**

3.6 User Interaction

User interaction contains all forms of engagement between users and the interface, from clicking buttons to navigating menus. Effective interaction design ensures that these engagements are responsive and enjoyable, fostering a positive user experience.

In my e-commerce website, I focused on delivering smooth and responsive interactions. Features like hover effects provide immediate feedback, when clicking on a question in the FAQs section the answer will pop up and the use of drop-down menus on the product screen are all forms of effective user-interaction keeping the user engaged. This also created a streamlined and seamless browsing and shopping experience.

For the mobile application, I prioritized touch-based interactions and optimized them for mobile devices. I used animations, to provide feedback to the user, and to keep the user engaged. I designed large, easily tappable buttons and icons to minimize errors and improve efficiency. I incorporated haptic and visual feedback to provide tactile and visual confirmation for user actions, such as adding an item to the basket or completing a payment. I implemented a smooth scrolling experience and ensured that all interactive elements were responsive and provided immediate feedback.

References:

- Book: Scott Klemmer. 2021. **Designing Interactive Systems.**

3.7 Haptic/ Tactile Technology

Haptic technology increases the interaction between the user and the interface by providing haptic/tactile feedback, invoking one of the senses by vibrating or pressure.

Currently, I have not included any haptic or tactile feedback in my project for the website. However, the next phase of my project will be the mobile application, which will include this feature. For example, when pressing a button, the phone will vibrate to reaffirm the action.

In the mobile application, I implemented haptic feedback to enhance user interaction and provide tactile confirmation for key actions. For example, when a user taps a button, such as 'Add to Basket' or 'Checkout,' the device provides a subtle vibration to acknowledge the action. I have made sure to test the haptic feedback, on a range of devices, to ensure that the feedback is consistent, and effective.

References:

- Book: Katherine J. Kuchenbecker. 2012. **Haptics: The Science of Touch.**

3.8 – Cognition

Cognitive considerations, such as memory, learning, and problem-solving, are vital in interface design. Reducing cognitive load ensures users can navigate and operate interfaces without feeling overwhelmed. This works hand in hand with other principles such as Heuristics and Perception.

My website utilizes clean labelling, sleek navigation, and simple instructions to simplify tasks like completing transactions, accommodating users with varying levels of familiarity and expertise. For example, referring to the location of the basket in most cases and on many top tier e-commerce websites it is in the top right-hand corner so, by placing it there on my website eliminates the process of the brain trying to look around for it as it already knows it is there.

For the mobile application, I focused on minimizing cognitive load by implementing a consistent and sleek interface. I used clear and concise language, avoiding jargon or complex terminology. I implemented a simplified navigation structure, using a bottom navigation bar for quick access to essential features. I also used icons that are commonly understood by users, to reduce the need for text like the cart icon. I have also made sure to keep the layout of the application consistent, to reduce the load on the user's memory.

References:

- Book: Susan Weinschenk. 2011. **100 Things Every Designer Needs to Know About People.**

3.9 Gender, Age, Cultural and Special Needs Considerations

User Interfaces ultimately need to consider the user, more specifically their gender, age, cultural and special need considerations. For example, not using difficult language for those not fluent in English or where suitable provide images to help, using gender neutral language and using contrasting colouring to accommodate to people with sight impediment.

In my e-commerce website I have used contrasting colours where possible to accommodate. I have also tried to use simple English where possible to allow the user to make the right choice with what

they are trying to do. However, in the instance where they are still not able to read then images are provided where necessary such as the products page or representing the basket with an icon instead of writing 'basket'. This further helps with accessibility and helping tackle all considerations.

For the mobile application, I extended the accessibility considerations by implementing features tailored to mobile users with diverse needs. I used larger, touch-friendly buttons and icons to accommodate users with motor impairments. I also made sure that the application was compatible with screen readers, for those with visual impairments. I have also added alternative text, for all images within the application. I have also tested the application, with a variety of emulators, and physical devices, to ensure that the application, works as expected, on a wide range of devices. I have also made sure that the application, has been designed, to be culturally neutral, and to avoid any potentially offensive imagery, or language.

Furthermore, a core key principle that ties into this subject is that of Accessibility. In terms of accessibility in HCI it measures how accessible the visual design of a UI, by those with impediments. Whilst researching into accessibility I came across the Web Content Accessibility Guidelines or WCAG for short. These are a set of guidelines and recommendations to follow in order to ensure that your user interface is 100% accessible to the user. There are four main principles of the WCAG: and within those principles are guidelines:

1. Perceivable:
    a. Text Alternatives
    b. Time Based Media
    c. Adaptable
    d. Distinguishable
2. Operable:
    a. Keyboard Accessible
    b. Enough Time
    c. Seizures
    d. Navigable
    e. Input Modalities
3. Understandable:
    a. Readable
    b. Predictable
    c. Input Assistance
4. Robust:
    a. Compatible

As the technological world constantly evolves, so does the WCAG as it is updated on a frequent basis to suit the needs of the users, to make user interfaces more accessible. In my project I have included

and abided by as many guidelines as possible to achieve accessibility and make it accessible for those with sight or any other impediment.

References:

- Book: Ben Shneidermann. 1986. **Designing the User Interface**
- Article/ Legislation: https://www.w3.org/TR/WCAG21/

3.10 Speech Recognition

Speech recognition technology supports hands-free interaction, beneficial for accessibility and multitasking. This is important in the real world mainly whilst driving. According to UK law you are not allowed to touch your phone but can still use it hands-free, i.e. with voice control. In terms of my e-commerce website, I have not included this feature, but I will be looking to include it into the mobile application in the next phase. In terms of my mobile application, I have not also incorporated speech recognition into the mobile application.

References:

- Book: Raj Reddy. 1996**. Speech Recognition Technology.**

3.11 Ethical Issues

Ethical considerations include data privacy, transparency and inclusivity. My website adheres to ethical standards by clearly communicating and ensuring that personal data isn't collected without their consent and that there are no hidden fees when purchasing. For the mobile application, I extended these ethical considerations by implementing robust data privacy measures, especially considering the sensitive nature of mobile data.

References:

- Book: Batya Friedman. 1996. **Value Sensitive Data.**

3.12 Navigation

An effective navigation supports users in efficiently exploring an interface. Clear labelling, and a responsive design are essential to the functionality of navigation.

In my e-commerce website, I have a navigation bar at the top the of the page allowing the users to navigate through the website effectively and efficiently. I have decided to use contrasting colours (black and red) to accommodate those with accessibility needs. When the user hovers over the label they wish to click on it changes to a lighter shade of red to acknowledge the fact that they are about to click this label. This also works hand in hand with user interaction. It uses clear and simple English to get the categories across without any confusion.

For the mobile application, I prioritized a consistent and modern navigation tailored to touch-based interactions and smaller screen sizes. I implemented a bottom navigation bar for quick access to essential features, such as 'Home', 'Categories', and 'Profile'. I also implemented a clear and consistent back button, to allow users to easily navigate back to previous pages. I have made sure that the navigation, is easily usable, with one hand. I have made sure that the navigation, is

responsive, and provides feedback to the user, for any interaction. I have also made sure that the navigation, is consistent, throughout the application.

3.13 Graphical Design

In terms of graphical design, the visual aspect is key. For example, the font choice is influential to the user's readability. Using legible fonts and a consistent design enhances accessibility.

With my e-commerce website, I selected a clean, modern font with appropriate sizing and spacing for the website, ensuring readability across devices while maintaining a professional appearance.

For the mobile application, I prioritized readability and visual clarity by selecting a sans-serif font optimized for mobile screens. I used a consistent colour palette, that matched the website, to maintain brand identity. I have made sure that the font size, is large enough, to be easily readable, on small screens. I have also made sure, that the line spacing, and letter spacing, are appropriate, to improve readability. I have also made sure, that the images, are high resolution, and that they are optimised for mobile devices, to reduce loading times. I have also used consistent icons, throughout the application, to improve visual consistency. I used many well-known mobile e-commerce apps such as Boohoo as inspiration on the design to name one.

- Book: Robin Williams. 2008. **The Non-Designer's Design Book**

3.14 Iconography

Iconography is the branch of art history which studies the identification, description, and interpretation of the content of images: the subjects depicted, the particular compositions and details used to portray them, and their connections with the history, literature, beliefs, and customs of particular times and cultures. It essentially seeks to understand the meaning behind the visual elements in art.

In terms of my web application, icons and images were used to replace the need for words thus eliminating that language barrier for non-English speakers. For example, this was used in places such as the basket icon instead of writing the word basket. This also links to Nielsens Heuristics as a basket or cart icon is a universal icon. These icons are widely used by other known e-commerce websites for recognition rather than recall.

The same can be said for the mobile application as well. The usage of icons has eliminated the use of words such as using a shopping cart, a search icon, a home icon, a categories icon, and a profile icon. These have all be used to replace words giving and presenting a much more sleek, modern and elegant finish.

3.15 Millers Law

Miller's Law, often referred to as the "Magic Number Seven, Plus or Minus Two," suggests that the average person can only keep a limited amount of information in their working memory at any given time. This capacity is typically around seven items, with individual differences allowing for a range of five to nine items. In the context of Human-Computer Interaction (HCI), this principle highlights the importance of presenting information in manageable chunks to avoid overwhelming the user and to improve short-term memory retention. By limiting the number of options, controls, or pieces of information displayed simultaneously, designers can reduce cognitive load and enhance usability. Miller's Law goes hand in hand with Cognitive Overload and how to manage it and not overload the brain.

In my e-commerce website, I have applied Miller's Law by organizing product categories into a concise main navigation menu, typically featuring no more than seven key categories. Within product listings, I have limited the number of key details displayed upfront, such as focusing on the product image, name, and price, allowing users to delve into more specific information on a dedicated product page. This approach prevents information overload on the initial browsing pages. Also giving a cleaner and more minimalistic look.

For the mobile application, adhering to Miller's Law is even more critical due to the smaller screen size. The bottom navigation bar features a maximum of three essential icons for primary sections, ensuring that users can easily access core functionalities without being presented with too many choices at once. When presenting lists of products or options, I have aimed to break them down into smaller, easier to process groups, often utilizing scrolling to avoid overwhelming the user with a long list on a single screen. This strategy helps users process information more effectively on a mobile device.

References:

- Book: George A. Miller. 1956. **The magical number seven, plus or minus two: Some limits on our capacity for processing information.**

3.16 Fitts Law

Fitts's Law is a predictive model in HCI that states that the time required to rapidly move to a target area is a function of the ratio between the distance to the target and the size of the target. In simpler terms, larger targets that are closer are easier and faster to select than smaller targets that are farther away. This law has significant implications for the design of interactive elements within user interfaces, influencing the placement and size of buttons, links, and other interactive components to optimize user interaction speed and accuracy.

In my e-commerce website, I have considered Fitts's Law in the design of interactive elements. Key buttons, such as "Add to Cart" and "Checkout," are designed to be sufficiently large and are placed in prominent and easily reachable locations on product pages and within the shopping cart.. This

consideration aims to reduce the effort and time required for users to interact with essential elements of the website.

For the mobile application, Fitts's Law is particularly important due to touch-based interactions. Buttons and icons for frequently used actions are designed to be large enough to be easily tapped with a thumb, minimizing the chance of errors. The bottom navigation bar features icons that are spaced adequately apart and are of a reasonable size for comfortable selection. Interactive elements within product listings are also designed with touch targets in mind, ensuring that they are easily selectable and contribute to a more efficient and user-friendly mobile experience.

- Book: Paul M. Fitts. 1954. **The information capacity of the human motor system in controlling the amplitude of movement.**

Chapter 4: **Web – Development**

4.1 Front-end Development

Front-end development focuses on creating the visual and interactive elements of a website. The languages I used were HTML, CSS and JavaScript to design the structure of the web page. HTML in essences is the foundation and the building blocks of the website, such as the content, whilst CSS focuses on the styling of the website enhancing the user's experience. JavaScript focuses on the interactive element and the functionality of the website.

During this project, I utilized the likes of HTML, CSS and JavaScript. The way I used HTML and CSS is to create a user-friendly interface to align with HCI principles of accessibility, usability, efficiency, to name a few. HTML was used to set-out the products listings, navigation bar, footer and the other pages. CSS was used to change the colour, font size, font style, placement of the information, background colour amongst many other visual features. JavaScript was used more for functionality purposes. For example, when a user would click an item to buy JavaScript would handle the function of storing the data and passing it onto another page (the basket).

References:

- Book: Jon Duckett. *HTML and CSS: Design and Build Websites*. 2011.

4.2 Back-end Development

Backend development involves managing the database side operations required to run the website. It makes sure that there is data stored, processed and retrieved efficiently. There are many database management systems such as Snowflake, MySQL, SQLite, and many more.

In this project, I decided to use SQLite as it was the easiest to use and set-up. I used SQLite database to handle product information such as the product ID, name and price. SQL queries were used to interact with the database, allowing the data to be retrieved and used. Additionally, local script allowed the products that were being bought to be used.

4.3 Optimization

Web performance optimization focuses on improving the speed and efficiency of websites, ensuring users experience minimal delays. Techniques include image optimization, minimizing HTTP requests, amongst many others. Faster load times enhance user satisfaction and can the likelihood that they revisit.

For this project, I optimized performance by compressing images, reducing file sizes, and using efficient coding practices. JavaScript and CSS files were minified to decrease load times, and asynchronous loading was employed to prioritize critical resources. For example, I used only one CSS file to cover all the product pages, where I could have used one for each but to optimize the website, I decided to only use the one.

Chapter 5: **Mobile Application Development**

5.1 Front-End Development

Front-end development focuses on creating the visual and interactive elements of a website. The tool kit I used was Flutter that uses the Dart programming language. Flutter is a an open-source UI software development kit which is created by google. It extremely useful for building mobile applications, which is why I used it for my project. Dart is the programming language that Flutter uses, it is Object-oriented class designed for building applications. In terms of similarity Dart is like that of C as Darts syntax has links to that of C. It is also like JavaScript, CSS and C# I used this for both the backend and front-end for the design and structure of the mobile application.

I focused on creating a visually appealing and user-friendly interface. I used Flutter's animation capabilities, such as ‘AnimatedContainer’ and Hero widgets, to add subtle transitions and visual feedback, enhancing the overall user experience. I also used Flutter’s ‘Card’ to section off areas to make the UI flow better and have better readability. I also used

I utilized ‘pubspec.yaml’ to manage the application's dependencies, ensuring that all third-party packages were compatible and up to date.

References:

- Book: Maximillian Schwarzmuller. Learn Flutter and Dart to Build iOS and Android Apps.2023

5.2 Back-End Development

Backend development involves managing the database side operations required to run the website. It makes sure that there is data stored, processed and retrieved efficiently.

For my mobile application, I implemented a local SQLite database to manage the shopping cart functionality. This allowed users to add, view, update, and delete items from their cart even when offline. I utilized the sqflite package in Dart to interact with the SQLite database.

The ‘DatabaseHelper’ class, as shown in the code, encapsulates the database operations. It implements a singleton pattern to ensure a single database instance throughout the application. The ‘_initDatabase()’ method creates or opens the ‘cart.db’ database file within the application's local storage. The ‘_onCreate()’ method defines the database schema, creating a cart table with columns for ‘id’, ‘productName’, ‘size’, ‘quantity’, and ‘price’.

The ‘insertCartItem()’ method inserts a new item into the cart table. The method first checks to see if the table exists, and if it does not, it then calls the ‘_onCreate()’ method. The ‘getCartItems()’ method retrieves all items from the cart table as a list of maps. The ‘deleteCartItem()’ method removes an item by its id. The ‘updateCartItemQuantity()’ method updates the quantity of an item by its id. Finally, the ‘deleteCart()’ method, deletes the entire cart table.

```
class DatabaseHelper {
  static final DatabaseHelper _instance = DatabaseHelper._internal();
  static Database? _database;

  factory DatabaseHelper() {
    return _instance;
  }

  DatabaseHelper._internal();

  Future<Database> get database async {
    if (_database != null) return _database!;
    _database = await _initDatabase();
    return _database!;
  }

  Future<Database> _initDatabase() async {
    String path = join(await getDatabasesPath(), 'cart.db');
    return await openDatabase(
      path,
      version: 1,
      onCreate: _onCreate,
    );
  }

  Future<void> _onCreate(Database db, int version) async {
    await db.execute('''
      CREATE TABLE cart(
        id INTEGER PRIMARY KEY AUTOINCREMENT,
        productName TEXT,
        size TEXT,
        quantity INTEGER,
        price REAL
      )
    ''');
  }

```

5.3 Optimization:

Mobile application optimization focuses on improving the speed and efficiency of the app, ensuring users experience minimal delays and a smooth, responsive interface. Techniques include optimizing image assets, minimizing network requests, and efficient code execution. Faster load times and a fluid user experience enhance user satisfaction and increase the likelihood of continued app usage.

For this project, I optimized the mobile application's performance by compressing image assets to reduce file sizes, thereby decreasing loading times and minimizing data usage. I implemented efficient data fetching strategies, minimizing network requests by caching frequently accessed data

and using asynchronous operations to prevent UI blocking. I also optimized the application's code by reducing redundant operations and utilizing efficient data structures.

Chapter 6: **Software Engineering**

In terms of Software Engineering, I have utilized many key aspects of software engineering into my project, this includes Version Control, Git, Testing and Structuring of files.

6.1 Version Control

In terms of Version Control, I had many iterations of my project during my project. I have a long history of the version, and are stored remotely, safe from hardware faults, which has allowed me to keep and access all the recorded data and progress in case I made a mistake and caused errors. In the case this happened, it was easy to go back to a previous version before the error and try again. Version Control is a vital part of any project, as it allows making changes and implementing new features easier to manage and control, like in the case of the 'AddtoCart()' function for my website.

6.2 Git

In my opinion, Git was if not the most vital part of applying version control as it allows me to keep a structured history of past commits and versions. It also allows me to create new branches when completing new front-end or back-end methods. This allowed me to test and manage new implementations with ease. In terms of the other functionalities of git such as pull requests and merging ensured that integrating branches was easy with conflicts and how to quickly fix them, to merge smoothly.

6.3 Testing

Testing was another vital part of my project as it allowed me to make sure that my project indeed was readable, accessible and efficient. I had conducted user testing with a range of participants using the questionnaire to retrieve vital feedback that would help me with improving my website. (I go into more detail in the User Feedback section). I also conducted some testing to make sure that the website was visible and functional on other search engines. I was mainly using OperaGX and the website was successfully tested on Chrome, Microsoft Edge and Firefox successfully.

6.4 Structure

In terms of the structure of my project, I had structured it with best practices in mind. I have separated the respective files into their respective folders. For example, I have all the html files in a file and 2 subfolders with css files and images in them. This allows the project to visually look better and is more organised when developing and makes it easier if there was another developer also trying to figure out the ins and outs of the website. I have also created a singular css file for the products page to optimize the website better instead of overcrowding the css files folder. In theory, I could have created subfolders for the html files however, because all the pages are interconnected, I was unable to do it in a sensible manner. There is also a folder for the database, this is where all the schemas and tables are stored for the website to access.

In terms of my Mobile Application, the structure of the project is similar to that of the website. With regards to the '.dart' files they are located in the 'lib' folder in the project. This is due to the 'main.dart' file already being located there and that is the path for the dart files to run from. The

images and assets used in the project are in the ‘img’ folder. When referencing or calling an image you have to declare it in the ‘pubspec’ first, and then you are able to call it.

6.5 Agile

Whilst developing the website and mobile application I decided to adopt several principles and aspects commonly associated with Agile methodologies. Although a formal Agile framework like Scrum wasn't strictly implemented with defined roles and meetings (As I was the only developer), the iterative nature of development, the focus on responding to feedback, and the flexible approach to feature implementation align with Agile values.

The description of having "many iterations" and easily going back to previous versions due to version control demonstrates an iterative approach. Instead of a monolithic waterfall model, changes and features like the ‘AddToCart()’ function were developed and integrated incrementally. This allowed for flexibility and the ability to adapt based on emerging needs or challenges encountered during development.

The emphasis on user testing and utilizing feedback from participants directly reflects a key Agile principle of continuous improvement and incorporating user input. The willingness to adapt the website and mobile application based on user feedback showcases a responsive approach to development, aligning with the Agile focus on customer collaboration.

The mention of creating new branches in Git for front-end and back-end methods indicates an incremental approach to feature development. This allowed for focused work on specific functionalities, such as new UI elements or server-side logic, without disrupting the main codebase. The ease of merging these branches after testing further supports this Agile-like workflow.

The emphasis on testing to ensure the website and mobile applicaiton was "readable, accessible and efficient" highlights a focus on delivering working software. Agile methodologies prioritize delivering functional increments of the product frequently, and the testing efforts demonstrate a commitment to ensuring the developed software meets quality standards.

6.6 Requirements Analysis

Functional Requirements:

- Accessible
- Browse through the different pages seamlessly
- Add items to cart of any size and quantity
- Remove Items from Cart
- Proceed to Checkout
- Confirm Purchase

Non-Functional Requirements:

- Using Search Bar to search for items.
- Create an Account.
- Increase Font Size.

Chapter 8: **Design Choices**

The following section will outline and detail on why I chose to design a specific element in that way for my website and mobile application. This will include colouring, layout and functionality.

8.1 Web Application

The following will outline my reasoning for my Web Application.

8.1.1 Home Page

In terms of my home page for my website, I decided to utilize a navigation bar across the top of the screen. This was done as I had noticed whilst researching known e-commerce websites this was seen as a standard for any website. I decided to put the cart in the top right as that was also done on most websites allowing the user to know from memory where the cart is instead of looking around the website for it. This was a use of Nielsens Heurists. The search bar is the highest element of the website as that is also where it is most of the time on known websites such as Ebay, Boohoo, Asos, etc. I used red as the categories as I thought that it would match the subtle hint of red that is on the website throughout and is a good contrasting colour against the black background.

I decided to also include a slider. The slider was used to showcase the top products that I have on offer on my e-commerce website. This was used as a visual hierarchy to draw the user's attention to encourage engagement and exploration of what's on offer on the website. There are bright and bold colours being displayed on the slider such as purple and black to show luxury as purple has connotations to royalty or luxury and I thought black would be a nice complementary colour with purple. The Buy buttons and Price are both in green and white respectively to be contrasting colours towards the background so, it is easier to see.

In terms of the bottom navigation bar, it is there to represent the FAQs section or Frequently Asked Questions. This was used in many websites I looked at and I thought that it would be a good idea to include in my website as it is a quick and easy way to see contact information and questions that a user might have about the products so, their questions are answered nice and quickly instead of them going through 20 different pages to find their answer. When hovering above a question the answer pops up underneath, this was used to minimize clutter and decrease the chance of cognitive overload on the user. This also creates a minimalistic and modern look to the page. I used contrasting colours for the questions and answers (Red and Green respectively).

8.1.2 Categories Page

In terms of the categories page the nav bar on the top and bottom are the exact same to keep consistency across the pages so it doesn't look like a different website every time the page changes.

The products in their specific categories are displayed in a horizontal layout. This is because it looks more linear and not in columns and removes the need for scrolling. The Image of the product is displayed as the biggest asset on the card. Below is the name and price in black. This was done as it keeps a professional look and contrasting colours for the visually impaired. The button Add to Cart is below in purple to not make it look bland as that is one of the main colours used on the website.

8.1.3 Product Page

In terms of the products page the design of it is sticking to industry standards amongst other e-commerce websites. Where the image is the forefront and the main piece of the page. The Title of the product is in bold at the top of the page drawing the user's attention to it. The description of the product is in smaller text. Underneath the description is the price of the product. Initially I had the

colour of the price in green as it as connotations to that of money and wealth so, you could put two and two together, but this didn't visually look aesthetically pleasing as the green used was not a good contrasting colour and I feared that people with sight impediments would struggle. So, I decided to use red as the colour as it would draw attention to the price and was also a good contrasting colour to the background.

The buttons underneath of the Add to Cart and Buy Now are in purple keeping with the websites theme, showing consistency and looking visually appealing.

Underneath are Customer reviews of the products, helping the user to making a purchase on the products and how much other people that have bought the product enjoyed the product.

8.1.4 Basket

In terms of the basket for the website, I decided to use cards as a good demonstration of presenting the items that the user wishes to purchase. This not only looks visually appealing but also looks modern and minimalistic decreasing the chance of cognitive overload. There is still enough information on the cards to show what the products are and how much they cost which is all that is needed to be presented in a basket. In terms of the colouring, I used the theme that I have been using so far of purple, red and green. They are also all good complementary and contrasting colours, helping the visually impaired. The remove button is in red as that is a universal colour for a remove button.

8.1.5 Checkout

In terms of the checkout section, it is in a vertical layout to show a streamlined approach as this was a better layout for this specific page. The information that is present is all the information that you would have to naturally enter when making any sort of payment on a website. I have used white as the font and the main background around the section is black so both complementary and contrasting. The headings are in red keeping with the websites theme. With the button for placing the order in purple.

8.2 Mobile Application

8.2.1 Welcome

Starting off with the welcome page, I decided to try and keep the colour scheme the same to show brand consistency across both applications. However, the shade of purple and just black did not look aesthetically pleasing so, I decided to change the shading of the colours to make it better optimized for the phone screen. The logo of the brand is the centre piece whilst there are 2 buttons underneath, one for entering the mobile app and the other to exit.

8.2.2 Home Page

With the home page, I decided to transfer across some similarities with that of the website, mainly the usage of the slider for featured products. Although they are the same products on the Featured products and Trending Now section there would be future improvements showing trending products based on sales. I have decided to go with a grey background with a shade of 900 to make the colouring pop that ever so more as pure black looked very dull and outdated. A decided to keep with the purple theming and as it represents royalty, luxury and other positive thinking connotations.

In reference to the upper navigation bar there is the title of the page in purple and bold showing consistency, and it reminds users on what the page is. In the top right, there is the search function and the basket icons. When doing my research on inspiration to take from well known e-commerce mobile applications some had the basket in the top right of the upper nav bar or on bottom nav bar. I thought to myself that it might look a bit too cluttered if there were many icons on the bottom nav

bar especially if the user has a smaller sized phone. So, to try to accommodate for everyone I placed it in the top right.

The bottom navigation bar has the home icon for the main dashboard, four squares icon for categories and a human icon for the profile section. This works hand in hand with the theory of iconography as I haven't explicitly stated where these buttons take you, but the user will automatically know due to heuristics and universal usage of those icons.

The Trending now section is in a double column formation. I did this because it would fill the screen without leaving redundant spaces and encourages the user to scroll but not for that long.

8.2.3 Categories

In terms of the categories section, I have decided to use that double column formation of cards again as I believe it was the best usage of spacing and grouping to look good and decrease clutter and cognitive overload.

When navigating through the bottom navigation tab the new tab appears from the bottom of the screen, this was done to make the experience less boring and more engaging in an attempt to increase user satisfaction and make the overall experience enjoyable.

8.2.4 Product Page

The product page demonstrates a clean and sleek look with the image of the product the main focus of the page. Under it is the Title of the products along with the price in purple to add a bit more colour. The product description is underneath it along with the select size and quantity options, along with the add to cart button.

When clicking the add to cart button, an animation will play to confirm that the product has been added to the cart. This was done as the prompt that I had before seemed to be a bit boring and not engaging enough. This way this visual is more appealing and more noticeable.

8.2.5 Profile Page

With the profile page, I created it as a separate page to decrease clutter on all the other pages and to reduce overload. So, with its separate page I was able to design a page where you are able to have a profile picture with your name and email address underneath. The tabs that you are able to click on in the profile section is to edit your profile details, Promo Codes and Coupons, my orders, Wish List, Addresses, Help and Support and Logout. These are all represented by different colours to make it look more aesthetically pleasing.

With the Help and Support Page, you have a FAQs section where there are drop down tabs for finding out the answers to the questions. Alongside Contact details like that of the website. There is also a Help centre with Terms and Conditions and Privacy Policy. These were all present in e-commerce apps that I researched, they may not have all been where I decided to place them, but they were present nevertheless and I think where they are in my app makes the most sense.

8.2.6 Basket

The basket page is a simplistic minimalist page that is designed to only present the information absolutely necessary on this page. So, the name, the price, size, quantity and the option to remove and edit the product. With a white card on a grey background with a purple border is has the right amount of colour to monochrome ratio looking minimalistic and aesthetically pleasing at the same time. The total for the entire basket is at the bottom next to the checkout button. The total is in green due to its connotations to wealth and money. The checkout button is in purple writing with a white background due to its contrasting colours to the dark grey.

8.2.7 Checkout

The Checkout page has a slightly different theme to the rest as the background is a lighter grey with the top bar in purple. This was done to give it a slightly different look to the rest to inform the user that this indeed is the checkout section where sensitive data is inputted, making the user more aware and less likely to make a mistake. The total price is in black as a contrasting colour to the background. The place order button is in purple to match the top bar theme.

After clicking place order, you will be presented with an animation to show that your payment has been processed, and a confirmation email has also been sent to the email address.

Chapter 9: **Peer Feedback**

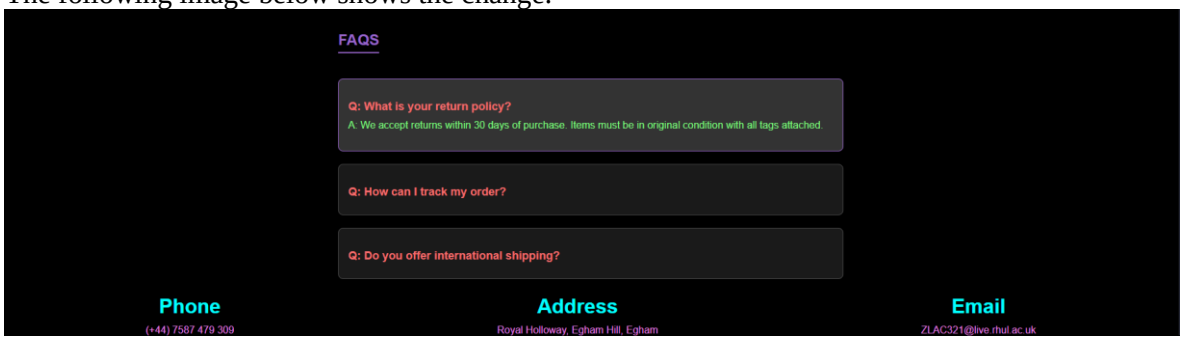
In the following section, I will be discussing the Peer Feedback that I received during the process of the project. I have been conducting Peer Feedback tests/ user testing throughout the project making sure every aspect and functionality is refined to the needs of the majority of the users. The peer feedback is made up of a variety of people including people of different genders, ethnicities, ages (15-48), different strength in eyesight and people with impediments. Unfortunately, you cannot accommodate for everyone as I soon found out during the testing process. For example, some users preferred colour A and some preferred colour B so, I had to make the decision to go with the majority. Below will be the responses I had to the user tests and my changes:

9.1.1 FAQs Section

A response from the user feedback was in reference to the FAQs section or the Frequently Asked Questions section, more specifically the whole layout, colouring and design behind was described as boring, outdated and overall, poorly designed.

My response to this was to change it completely by changing the design, colouring and layout. The change was more aesthetically pleasing, enhanced interaction between the user and the interface. Now, when hovering over the question the answer will now appear underneath the question and will disappear when the cursor moves off the question.

The following image below shows the change:



9.1.2 Colouring

A response from the user feedback was in reference to the overall colouring of the website. Originally, I had a green, red and black themed colour scheme throughout the website. The peer feedback was that the green was too harsh on the eyes according to some. One of the users, that provided feedback was colourblind, more specifically Protanopia which means he is Red-Blind, so he had a hard time differentiating between the red and green in some instances.

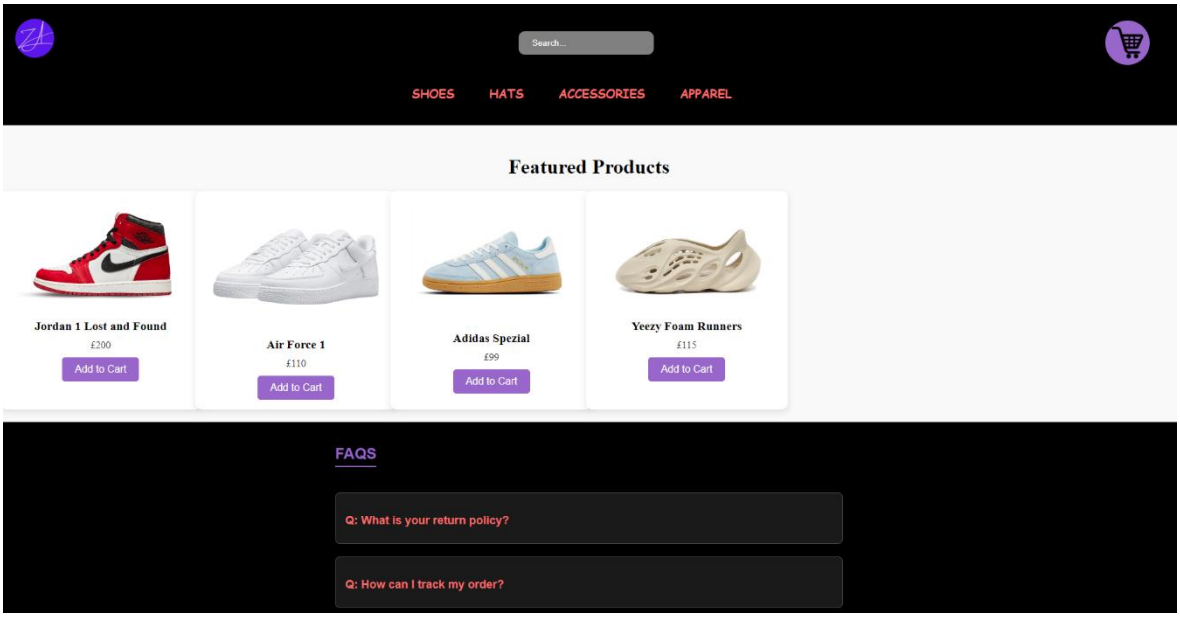
My response to this user feedback was to completely change the colouring and visual look of the website. I decided to adopt a purple theme due to the connotations it carried with it plus it satisfied majority of the testers as they were able to make distinctive contrasts between labels, images and other objects.

9.1.3 Consistency

A response from the user feedback was in reference to the consistency of the button styling, colouring and overall style in general. The button styling was initially different page to page as I wanted to keep it different to identify the different pages. However, this didn't come across well with the users, as they would prefer a more unified look for the buttons. Initially, the colour of the buttons was the

shade of red that you would find in the navigation bar. However, the users mentioned that there was too much red and it had to be balanced out.

Due to this response, I decided to change it to the purple theme that is the main theme of the website. This not only eliminated the over-use of red but also looks more aesthetically pleasing.



9.1.4 Nav Bar Spacing

A response from the user feedback was in reference to the navigation bar spacing of the labels. Originally the labels had a wider spacing between them. Where “shoes” were all the way to the left and “Apparel” was all the way to the right and the middle two were separated slightly. The user feedback was that it looked slightly awkward as it was too far apart.

Due to this feedback, my response was to make it more central, and it made it look so much sleeker and more refined. It also works well in relation to the upper items like the icon, search bar and the cart as it also gives a better visual appeal.

9.1.5 Buy Now option

A response from the user feedback was in reference to the lack of a “Buy Now” option on the product page. Initially, there was only a “Add to Cart” button that would add the item to the cart and keep you on the same page and allow you to go to another product page to go make a purchase. However, a question of “What if you only wanted to buy 1 item?” appeared during the user feedback.

My response to this question was to include a “Buy Now” button which essentially would take you straight to the cart to make the purchase. This changed satisfied the testers as it was better in the scenario if you only wanted to make 1 purchase and it would eliminate the process of 1 extra click, which will increase user satisfaction.

9.1.6 Basket Page Layout

A response from the user feedback was in reference to the basket page layout. More specifically it was in relation to the layout of how the basket was being presented. After researching different layouts of how the basket is displayed on popular websites, I decided to take inspiration from them and create it to be my own. A response from the user testing was that the basket didn't really seem to be portraying itself as being modern or fit in line with the styling of the website.

My reaction to this user feedback was to do a massive overhaul of the basket page. I dropped all the aspects that made it seem dated (layout and colouring) and adapted it to be dynamic and modern. So, when an item is added to the basket the new item will be added to the right and then the next item will be added below, in a 2 wide column style with the name, quantity and price of the item. The total price is now fixed at the bottom of the page allowing the user to see the price as a constant on that page in case they scroll too far up or down. This new layout promotes user interaction, looks more aesthetically pleasing, looks more modern and coincides with HCI principles.

9.1.7 Checkout Page Layout

A response from the user feedback was in reference to the Checkout page layout. A similar response to that of the basket page as it seemed to be very outdated and plain. Originally, it had a white background to make it easier for the user to not make a mistake when inputting their information however, the user feedback suggested that this was not the case as it was too bland and not modern-looking.

My response to this was to change the layout, colouring and style of the checkout page to suit the users' requests, much like the basket page. The checkout page is now in the styling of the rest of the website, the layout is more streamlined and chronologically ordered. It now doesn't allow you to purchase anything if the fields are not filled in. For example, if the name box or the postage address is not filled then the page will indicate that the specific boxes need to be filled to continue with the purchase. This further promotes the principles of user interaction, modernisation, it is more aesthetic and enhances other HCI principles.

9.1.8 Redundant Buttons

A response from the user feedback was in reference to the buttons on the Dashboard. Initially I had buttons on the dashboard with the option to add them to cart. After some responses it was clear to me that it seemed to be a bit useless and redundant to have them there as well as the images of the product.

My response to this was to completely remove those buttons and, in its place, I transfer the navigation to those products to the actual images and make them act as the buttons. This change offers a sleeker and more refined finished to the dashboard page whilst also removing some clutter, reducing cognitive overload.

9.1.9 Font and Button Styling

A response from the user feedback was in reference to the Font and Button Styling. Firstly, the feedback received mentioned that the font looked outdated, slightly boring and not enticing enough thus failing my objective of attracting and using HCI to create a mobile application. Aswell as the Font, the Button styling was a similar issue.

My response to this was to change the font-styling from the boring and basic look and give it a more futuristic and modern look, keeping with the times. This not only increases the aesthetic of the application but also increases the readability thus in turn increasing user satisfaction, which is a necessity for creating an application and designing a UI. The same was done for the button styling.

9.1.10 Product Descriptions

A response from the user feedback was in reference to the product description for some of the products on sale. The issue was that some of the products were lacking some descriptions and that the styling looked a bit cluttered in some places.

My response to this was to add the product descriptions that were not added and change the UI for the product descriptions. This change has increased readability, efficiency and accessibility.

9.1.11 Product image rescaling

A response from the user feedback was in reference to the images for the products and their resolution issues. The feedback was in referring to the zoomed in images for some of the products that are on sale. They seem to be zoomed in too much on some images.

My response to this was to changes the resolution scaling of the images to make them more in line with the box that the image is in, to allow the user to see the entire product of which they intend to buy. This will allow the user to visually see the product more clearly which will allow the user to perhaps be more inclined to spend money on the product. This increases user satisfaction and readability.

9.1.12 Accessing Checkout when Cart is empty

A response from the user feedback was in reference to the cart page. More specifically, the button to proceed to the checkout was available when the cart was empty thus meaning you were paying £0 for nothing. This is a huge issue and error as this was not supposed to happen.

My response to this was to see if the cart was empty and to then make the button appear if there is only something in the cart. This makes the cart and checkout method more efficiently and allows it to be more efficient and more streamlined.

9.1.13 FAQs outdated Styling

A response from the user feedback was in reference to the FAQ section in the website's design. Users pointed out that the styling of the FAQ section appeared outdated and did not align with the modern aesthetic of the rest of the website. This inconsistency detracted from the overall user experience and made the section feel less engaging.

My response to this was to redesign the FAQ section using a more modern styling approach. I implemented a clean, modern-style layout with subtle animations to reveal answers when questions are clicked. I also updated the font and colour scheme to match the rest of the website's design, ensuring a cohesive look and feel. This improved the visual appeal of the FAQ section and made it more user-friendly.

9.1.14 Lack of Animations

A response from the user feedback was in reference to the lack of animations throughout the mobile application. Users felt that the site lacked dynamism and interactivity, which made the browsing experience feel somewhat static and unengaging.

My response to this was to incorporate subtle animations and transitions throughout the website. I added hover effects to interactive elements, such as buttons and product images, to provide visual feedback and enhance user engagement. I also implemented smooth transitions between pages and added subtle animations to UI elements, such as the shopping cart and product details, to create a more dynamic and enjoyable user experience. This improved the overall interactivity of the website and made it more engaging for users.

Chapter 10: **Challenges and Lessons Learned**

10.1 Coursework overload

This project spans the length of the entire term so, it would have been a difficult task to manage this project alongside my other coursework's perfectly. There have been some delays in the project as I had deadlines for other coursework that I had to prioritize. This does not mean that my project was done at any level less than giving my 100% to this project. However, If I had more time to work on this project, I would have looked to implement the search function.

10.2 Lack of knowledge

In terms of Human-Computer Interaction (HCI), it is a new concept and subject for me so, learning it in this short period of time and then applying my knowledge was a difficult task but I believe I have applied what I have learnt to the best of my abilities. HCI is such an interesting subject in the sense that it influences all our daily lives with the smallest things, that's why I also believe I have not scratched the surface in terms of this subject area.

10.3 Database configuration

In terms of technical trouble, I initially had trouble on the implementation of the database. Originally, I was going to use MySQL, however it was causing a bit of an issue when trying to set-up the server and then connect to it. After a lot of trial and error, I decided to instead use SQLite. SQLite took significantly shorter to set-up, and I was able to make a connection to the database and set-up tables for my products with their ID, name and pricing.

The same can be said for the Mobile Application. I initially decided not to use SQL as I didn't have an enjoyable experience with it in the web application so, I was a bit sceptical. However, I did end up using an SQL database configuration. However, the dependencies were misaligned in the '*pubsepc.yaml'* so, I had to change many dependencies to fix the constant issues I was experiencing. After fixing this issue it was plain sailing from there on out.

10.4 Accessibility

In terms of accessibility, my website has tried to accommodate for the majority or find a middle ground to suit all the needs and wants from the user tests. For example, the colouring might be an issue for some but a way I have mitigated this issue to the best of my ability is by using contrasting colours to make colours that more definitively if the user has a hard time seeing it. If the user is not fluent in English or is a non-English speaker, I have used basic English to help convey the information across without overwhelming the user with information.

10.5 Basket Implementation

Another Challenge I faced was trying to decide on how to implement the basket, more specifically how I would make it work. Initially, I thought I would have it where the user would click add to cart, and then it would add the item to a SQL table in SQLite. However, I had difficulty on trying to implement this. So, I decided to instead implement a different way by storing the product information

into local storage and then fetching it in the basket page. A similar algorithm was used in the checkout page as well.

10.6 Flutter Inexperience

A challenge I came across during this project was in terms of my Flutter and Dart inexperience. This is the first time I have used Flutter and Dart so; I have little experience using this toolkit and programming language. Although Dart is similar to C and other languages it was still different and unique. So, finding issues and errors were a working progress and I didn't know fully how a flutter package was set out but thankfully, Flutter is very user-friendly in the sense of telling you where the issue can be found and a potential fix for the issue or error. It took me a significant amount of time to try and understand the concepts and functionalities of Flutter along with best practices.

10.7 Emulator Issues

Another challenge I faced during this project was in terms of the deployment and configuration of the android phone emulator. I experienced difficulties in establishing a stable connection between the development environment (Flutter/Android Studio), the Android Software Development Kit (SDK), and the emulator itself. This manifested in issues such as the emulator failing to launch, crashing unexpectedly, or not correctly reflecting code changes deployed from the IDE. Linking the android SDK to VScode was another hurdle as VSCode was not recognising the Android SDK file path. Troubleshooting these problems often involved diagnosing SDK path configurations, ensuring proper emulator settings, and sometimes even requiring the creation of new emulator instances. Resolving these linking issues was crucial to effectively test and debug the mobile application throughout its development.

10.8 Git

A significant setback and challenge occurred during the project when the Git branch, I was actively working on unexpectedly disappeared. This resulted in my local repository reverting to a state reflecting work completed in December, rather than the current progress up to this point. While the more recent work was on the remote Git repository, attempts to recover the lost branch locally proved difficult. I tried creating a new branch and attempting to pull the missing work, but this didn't work. Ultimately, to resolve this issue and ensure a clean working environment, I decided to clone the entire Git repository again. I created a new local branch, which successfully synced with the remote repository, allowing me to resume development with the latest version of my work. This incident highlighted the importance of regular commits and potentially more robust branching strategies to mitigate the risk of data loss.

Chapter 11: **Professional Issues**

The development of an e-commerce website and mobile application, driven by Human-Computer Interaction (HCI) principles, presents a range of significant professional issues that extend beyond the purely technical aspects of design and implementation. These issues touch upon ethics, societal impact, and the responsibilities of a computing professional in ensuring a positive and trustworthy user experience. This section will explore several key professional issues that have been particularly relevant during the development process of this project, focusing on accessibility, privacy, and the ethical considerations surrounding user data to name a few.

11.1 Accessibility

Web accessibility is the practice of ensuring that websites, tools, and technologies are designed and developed so that people with disabilities can use them effectively. [1] This encompasses a wide range of disabilities, including visual, auditory, physical, speech, cognitive, language, learning, and neurological disabilities. [1] Fundamentally, accessibility is about providing equal access and equal opportunity in the digital realm [1], reflecting the web's intended universality. [1] It is increasingly recognized not just as good practice, but as a basic human right and an ethical imperative for computing professionals. This aligns directly with core principles in professional codes, such as contributing to human well-being and ensuring broad accessibility (ACM 1.1), promoting fairness and non-discrimination (ACM 1.4) [2], and the BCS emphasis on public interest and promoting equal access to IT benefits. [3] Inclusive design complements accessibility by advocating for learning from human diversity and designing experiences that work for the widest possible range of people and situations. Notably, many accessibility features improve usability for all users in various contexts, such as using captions or ensuring good contrast.

As previously stated in my Human Computer Interaction Research section, the internationally recognized standard for web accessibility is the Web Content Accessibility Guidelines (WCAG), developed by the World Wide Web Consortium (W3C). [1] WCAG is organized around four principles, known by the acronym POUR: content must be Perceivable, Operable, Understandable, and Robust. [2] It defines success criteria at three conformance levels: A (minimum), AA (mid-range, widely accepted target), and AAA (highest). In the UK, the Equality Act 2010 requires service providers (including private businesses) to make "reasonable adjustments" to ensure their websites are accessible to people with disabilities. [4] While enforcement against private sector websites in the UK has historically been limited, the legal landscape is evolving.

In terms of my project, I have used and complied by the WCAG as a guideline for how to design my e-commerce page. I made sure that all colours can be seen as they are contrasting colours. This can be seen on my website and on my mobile application where I have used contrasting colours for the buttons, headings, and images to name a few. I made sure that this was compliant by using an online colour blindness tool.

11.2 Reliability

For an e-commerce platform handling financial transactions and user accounts, ensuring robust security and operational reliability is not merely a technical requirement but a core professional and ethical obligation. [3] Failures can lead to direct financial loss for users and the business, compromise sensitive data, erode trust, and potentially impact public well-being. [3]

A critical aspect is secure payment processing. Any entity that stores, processes, or transmits cardholder data must comply with the Payment Card Industry Data Security Standard (PCI DSS). [5] PCI DSS outlines twelve core requirements covering network security (e.g., firewalls), secure system configurations (e.g., changing defaults), protection of stored cardholder data (e.g., encryption, masking, minimal storage), encryption of data in transit, malware protection, secure development and maintenance (e.g., patching), strict access control (need-to-know, unique IDs, authentication), physical security, logging and monitoring, regular security testing, and maintaining information security policies. [6] Compliance levels and validation methods (e.g., Self-Assessment Questionnaires (SAQ) or audits by Qualified Security Assessors (QSA)) vary based on transaction volume. Many e-commerce businesses, especially smaller ones, mitigate the complexity by using compliant third-party payment gateways (e.g., Stripe, PayPal) to handle card data directly, reducing their own PCI DSS scope.

In terms of my project, I did not use a legitimate checker to check if the credit card or debit card were real. It does not use actual payment it only checks if the card details being inputted have a 12-digit card number a 3 number CVV number alongside an in-date expiry date. If I had the chance to handle payments legitimately then I would abide by all the standards and legal requirements.

11.3 Privacy and Security

E-commerce platforms, by their nature, collect and process a significant amount of personal data, including names, contact details, addresses, purchase histories, and potentially payment information. [7] This immediately engages ethical responsibilities concerning privacy and confidentiality (ACM Principles 1.6, 1.7 [8]; BCS Public Interest [3]) and triggers stringent legal obligations under the UK General Data Protection Regulation (UK GDPR). [9]

Key UK GDPR requirements mandate that data processing must be lawful, fair, and transparent; collected for specified, explicit purposes (purpose limitation); adequate, relevant, and limited to what is necessary (data minimization); accurate; stored no longer than necessary; and processed securely (integrity and confidentiality). [9] Obtaining valid consent is paramount, especially for activities not strictly necessary for fulfilling the service, such as marketing communications or the use of non-essential tracking cookies. [10] Consent must be explicit, freely given, specific, informed, and unambiguous – typically requiring an active opt-in, meaning pre-ticked boxes are non-compliant. [9] The use of 'dark patterns' – deceptive user interface designs intended to trick or manipulate users into providing consent or sharing more data than they intend – is unethical and contradicts GDPR's requirements for valid consent. [11] Transparency must be provided through clear, accessible privacy policies detailing data practices.[12] Furthermore, individuals retain significant rights over their data, including the rights to access, rectify, erase ('be forgotten'), restrict processing, and object to processing.

In terms of my project, I do collect the data as stated above. However, it is not being stored anywhere on a remote server it is purple all local storage based. The Data is then deleted afterwards when you complete your purchase.

Chapter 12: **Critical Analysis and Discussion**

This project, encompassing the development of both a web and a mobile e-commerce application, has been a valuable learning experience. This chapter provides a critical analysis of the development process, the quality of the deliverables, and the lessons learned.

12.1 Analysis

With the project specification in mind, I thought to myself that an e-commerce website and mobile application would be the best to present and utilize the concepts and principles of Human Computer Interaction. Whilst using the Software development lifecycle, I was constantly receiving peer feedback as a part of my user testing as well as allowing myself to research further into the topic of Human Computer Interaction.

The structured approach to HCI principles, where theoretical and practical concepts were explicitly considered and applied to both interfaces, contributed significantly to the user-centric design. The usage of Flutter for the mobile application proved to be a productive choice, enabling cross-platform development and rapid UI iteration, despite the initial learning curve. The use of Git for version control, even with the encountered branch issue, demonstrated an understanding of collaborative development practices and the importance of tracking changes.

The initial lack of in-depth experience with Flutter undoubtedly introduced some delays and potentially less optimized code in certain areas. The reliance on a local SQLite database for the mobile app's cart, while practical for this project phase, would need to be integrated with a more robust, scalable back-end solution for a production environment, the same can be said for the database of the website as that is also local. The web application, while functional, could benefit from more extensive user testing with a larger and more diverse group to identify further usability improvements. The Git branch issue highlighted a need for more rigorous branching strategies and a deeper understanding of Git's recovery mechanisms.

12.2 Evaluation of Web Application

The web application successfully implements the core e-commerce functionality, allowing users to browse products and simulate the purchasing process through a functional shopping cart and checkout flow (albeit without actual payment processing). The application demonstrates a clear application of HCI principles in its layout, navigation, and aesthetics.

The consistent visual design, informed by colour theory and aesthetic considerations, contributes to a modern and luxury user interface. The navigation is clear and easy to follow and understand, and key elements are placed in expected locations, reducing cognitive load. The integration of peer feedback and user testing resulted in improvements to layout structuring, consistency of the design, and the styling of the FAQ section, demonstrating a rapid response to user input. The website also incorporates basic accessibility considerations, such as contrasting colours and using images or icons where necessary.

While functional, the website lacks advanced features such as user accounts, personalized recommendations, and a usable search functionality. Further optimization for page load times, particularly for image-heavy pages, could enhance the user experience and bolster user satisfaction. More varied and concise user testing would likely reveal additional areas for usability refinement, to improve readability, efficiency and effectiveness.

12.3 Evaluation of Mobile Application

The mobile application successfully implements the core e-commerce functionality, allowing users to browse products and simulate the purchasing process through a functional shopping cart and checkout flow (albeit without actual payment processing). The application demonstrates a clear application of HCI principles in its layout, navigation, and aesthetics. The use of Flutter enabled the creation of a visually appealing and responsive interface optimized for touch interactions.

The mobile application effectively demonstrates platform-specific UI patterns and gestures, contributing to a familiar user experience. The implementation of a local SQLite database for the shopping cart allows for offline functionality, a significant advantage for mobile users. The consideration of mobile-specific HCI principles, such as thumb-friendly navigation and touch target sizes, enhances usability on smaller screens. The inclusion of haptic feedback for key interactions provides valuable tactile confirmation. In terms of the design of the mobile application, I have gone through several iterations of what the final design might look like, as can be seen by my git commits, this is a result of constant feedback and testing allowing myself to adjust and redesign where needed to meet user requirements and meet HCI principles. This all adds to the increase in user satisfaction and the likelihood they may buy something on the app.

Similarly to the web application, the mobile app currently lacks features like user accounts and integrated payment processing. Although I have created an account section, you are unable to login and logout of the account like any other e-commerce mobile application. The local SQLite database for the cart would need to be synchronized with a server-side database for persistent storage across devices. More extensive testing on a wider range of physical mobile devices would be beneficial to identify and address any UI inconsistencies or errors.

12.4 Conclusion

In Conclusion, the project and I demonstrate a strong understanding of software development principles, HCI concepts, and the practical challenges of building both web and mobile applications. The deliverables, while not production-ready, effectively showcase the core functionalities and design considerations for an e-commerce website/application. The iterative development process, incorporating user feedback and adapting to technical challenges, reflects a pragmatic approach to software engineering.

The challenges encountered, such as the initial inexperience with Flutter and the Git branch issue, provided valuable learning opportunities and highlighted areas for future skill development. The successful implementation of core functionalities on both platforms, despite these challenges, underscores a commitment to problem-solving and perseverance.

This project represents a significant step in my development as a software engineer. The critical analysis of the process and deliverables has provided a clear understanding of the strengths and weaknesses of my approach, as well as valuable insights into best practices for future projects.

Chapter 13: **Conclusion and Future Works**

In terms of future works that I would like to do to this project would be to continue upon the mobile application. More specifically, I would like to implement the search function to be a working feature. I would also develop the linkage between the profile page and the checkout screen so, you would not have to input your name. This would make the users life easier as it would save time in the checkout process. This not only increases user satisfaction but also efficiency and effectiveness. In terms of what I would have done differently, looking back I would also manage my time slightly better when doing multiple assignments for different modules

In this report I have discussed and explained my research into HCI, demonstrated my interfaces and explained my choices behind the design of it, conducting and responding to user testing, evaluated my working over this process and discussed professional issues.

In Conclusion, I believe I have done extensive research into Human Computer Interaction (HCI) which in turn as allowed me to create 2 HCI inspired interfaces, one of them being a website and the other being a mobile application. I have designed them in way to follow HCI principles such as accessible, efficient, effective, aesthetic and user-friendly to name a few. This process has allowed me to develop on skills that I already knew and develop on them and pick up new skills such as learning dart and flutter. With my HCI research is has allowed me to see interfaces in a new way and to now evaluate the effectiveness of an interface every time I encounter a new one whether it be a new shopping site or a news site or even a mobile game.

Appendix (Code)

Jacket</h1>
                <h2 class="sliderPrice">£999</h2>
                                                <button class="buy"
onclick="location.href='Coat_page.html';">BUY!</button>
            </div>
        </div>
                                <button class="arrow right-arrow"
onclick="nextSlide()">&#10095;</button>
    </div>

    <script>
        // Slider
        let currentIndex = 0;

        function showSlide(index) {
           const sliderWrapper = document.getElementById('sliderWrapper');
                sliderWrapper.style.transform = `translateX(-${index *
100}vw)`;
        }

        function nextSlide() {
                                                const totalSlides =
document.querySelectorAll('.sliderItem').length;
            currentIndex = (currentIndex + 1) % totalSlides;
            showSlide(currentIndex);
```

```
        }

        function prevSlide() {
                                                const      totalSlides      =
document.querySelectorAll('.sliderItem').length;
            currentIndex = (currentIndex - 1 + totalSlides) % totalSlides;
            showSlide(currentIndex);
        }

        //fetch function to retrieve from sql table
        async function fetchProductPrices() {
        const response = await fetch('http://localhost:5000/products');
        const products = await response.json();

        // implements price into product price.
        const priceElements = document.querySelectorAll('.sliderPrice');
        products.forEach((product, index) => {

            if (priceElements[index]) {

Bibliography and References

Abstract:

1. Martin Kleppmann.2017. **Designing Data-Intensive Applications**
    a. With Designing Data-Intensive Applications, this provides me with an insight on how to handle data in terms of HCI and will help with the website and mobile application as it provides an insight into how to create an effective and efficient interface.

2. Donald A. Norman and Peter Berkrot. 2011. **The Design of Everyday Things**
    a. In terms of The Design of Everyday Things, this provides a deeper understanding of HCI as it divulges into the many principles of the subject such as User Experience and other psychology principles such as cognitive recognition and many more.

3. Eric Hibit.2022. **Color Theory for Dummies**
    a. Color Theory for Dummies, provides a guide on how to use colours in an interface. This is especially important as interfaces need to be aesthetically pleasing for the user and not be bland but not too overwhelming with colour.

4. Ben Shneidermann. 1986. **Designing the User Interface**
    a. The Value that I have gained form Designing the User Interface is that it has helped me form a basic understanding of the subject and has provided a well-recognised definition of HCI.

5. https://www.w3schools.com/howto/howto_make_a_website.asp
    a. With the W3schools website, it provides a step-by-step tutorial on how to create a website with languages such as CSS, HTML and JavaScript. As I do not have a huge experience when it comes to web development this will be useful as it will provide a refresher.

6. https://medium.com/@blondiebytes/how-to-create-interactive-websites-with-javascript-627a6d998fed
    a. With the second website, it provides a guide on how to make a responsive and interactive website using JavaScript. This will be useful as it will improve the engagement between the computer and the user.

7. https://blog.hubspot.com/website/main-website-navigation-ht
    a. In terms of the last one, this focuses on navigation more than anything. This will help me when it comes to developing the navigation on the website.

8. **https://www.youtube.com/watch?v=tZvjSl9dswg**
    a. The YouTube video provides a tutorial on the basics on how to start developing a mobile application on android. This will help when it comes to the

development of the application.

9. Grant Allen.2021. **Android for Absolute Beginners: Getting Started with Mobile Apps Development Using the Android Java SDK**
    a. Grant Allen's Android for Absolute beginners is a guide for beginners on how to develop mobile applications using Java SDK and helps with the fundamentals of app development.

10. Mike van Drongelen, Adam Dennis, Richard Garabedian, Alberto Gonzalez, Aravind Krishnaswamy. 2017. **Lean Mobile App Development**
    a. Lean Mobile App Development introduces streamlined, efficient methods for developing mobile apps, emphasizing rapid prototyping and iterative improvements, aligning well with agile development practices and usability in HCI-focused projects.
